New ASE Valvular Regurgitation Guidelines- Endorsed by SCMR

What is New?

- Emphasis on identification of Etiology/Mechanism of regurgitation
- 2D/3D TTE--an integrative approach & algorithms to assess severity
- When is TEE needed
- Important role of CMR & CMR methodology
- The challenge of co-existing valvular lesions
- A clinical perspective...
- Library of case studies on the web

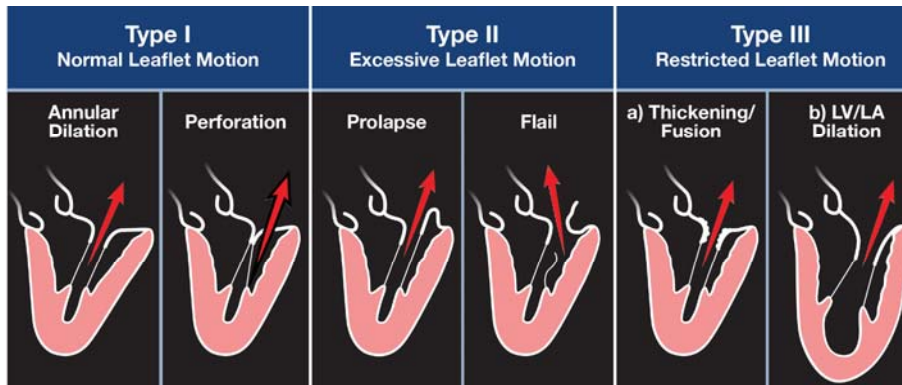

Mitral Regurgitation

Indicators of Severity

- Mitral valve pathology
- LV/ LA size
- Color Doppler:
Vena contracta, Jet Area, Flow convergence
- Mitral E; Pulmonary vein pattern
- Regurgitant flow/fraction
- CW *density and contour*

Carpentier Classification of Mechanisms of MV Regurgitation

Zoghbi W et al JASE March 2017

3D Echocardiography- MV

Zoghbi W et al JASE March 2017

Grading of Mitral Regurgitation

Grading the Severity of Chronic MR by Echocardiography ¹				
Parameters	Mild	Moderate	Severe	
Structural				
MV Morphology	None or mild leaflet abnormality (e.g., mild thickening, calcifications or prolapse, mild tenting)	Moderate leaflet abnormality or moderate tenting	Severe valve lesions (primary: flail leaflet, ruptured papillary muscle, severe retraction, large perforation; secondary: severe tenting, poor leaf coaptation)	
LV and LA size ²	Usually normal	Normal or mildly dilated	Dilated ³	
Qualitative Doppler				
Color flow jet area ⁴	Small, central, narrow, often brief	Variable	Large central jet (>50% of LA) or eccentric wall-impinging jet of variable size	
Flow convergence ⁵	Not visible, transient or small	Intermediate in size and duration	Large throughout systole	
CWD jet	Faint/partial/parabolic	Dense but partial or parabolic	Holysystolic/dense/triangular	
Semiquantitative				
VCW (cm)	<0.3	Intermediate	≥0.7 (>0.8 for biplane) ⁶	
Pulmonary vein flow ⁷	Systolic dominance (may be blunted in LV dysfunction or AF)	Normal or systolic blunting ⁸	Minimal to no systolic flow/ systolic flow reversal	
Mitral inflow ⁹	A-wave dominant	Variable	E-wave dominant (>1.2m/sec)	
Quantitative^{10,11}				
EROA, 2D PISA (cm ²)	<0.20	0.20-0.29	0.30-0.39	≥0.40 (may be lower in secondary MR with elliptical regurgitant orifice area)
RVol (mL)	<30	30-44	45-59 ¹⁰	≥60 (may be lower in low flow conditions)
RF	<30%	30-39%	40-49%	≥50%

1. Bolded signs are considered specific for their MR grade. All parameters have limitations, and an integrated approach must be used that weighs the strength of each echocardiographic measurement. All signs and measures should be interpreted in an individualized manner that accounts for body size, sex, and all other patient characteristics.
 2. This pertains mostly to patients with primary MR.
 3. LV and LA can be within the "normal" range for patients with acute severe MR or with chronic severe MR who have a small body size, particularly women, or with small LV size preceding the occurrence of MR.
 4. With Nyquist limit of 50-70 cm/sec.
 5. Small flow convergence is usually <0.3 cm, and large is ≥ 1 cm at a Nyquist limit of 30-40 cm/s.
 6. For average between apical two- and four-chamber views.
 7. Not valid with jets directed into the pulmonary vein.
 8. Systolic blunting is non-specific for mitral regurgitation.
 9. Most valid in patients >50 years old and is influenced by other causes of elevated LA pressure.
 10. Discrepancies among EROA, RF, and RVol may arise in the setting of low or high flow states.
 11. Quantitative parameters can help subclassify the moderate regurgitation group.

Zoghbi WA et al. J Am Soc Echocardiogr 2017; 30: 303-371.

Mitral Regurgitation- Color Doppler 3 Components of the Jet

Mitral Regurgitation

Mild Central

Severe Central

Severe Eccentric

Vena Contracta Proximal Jet Width

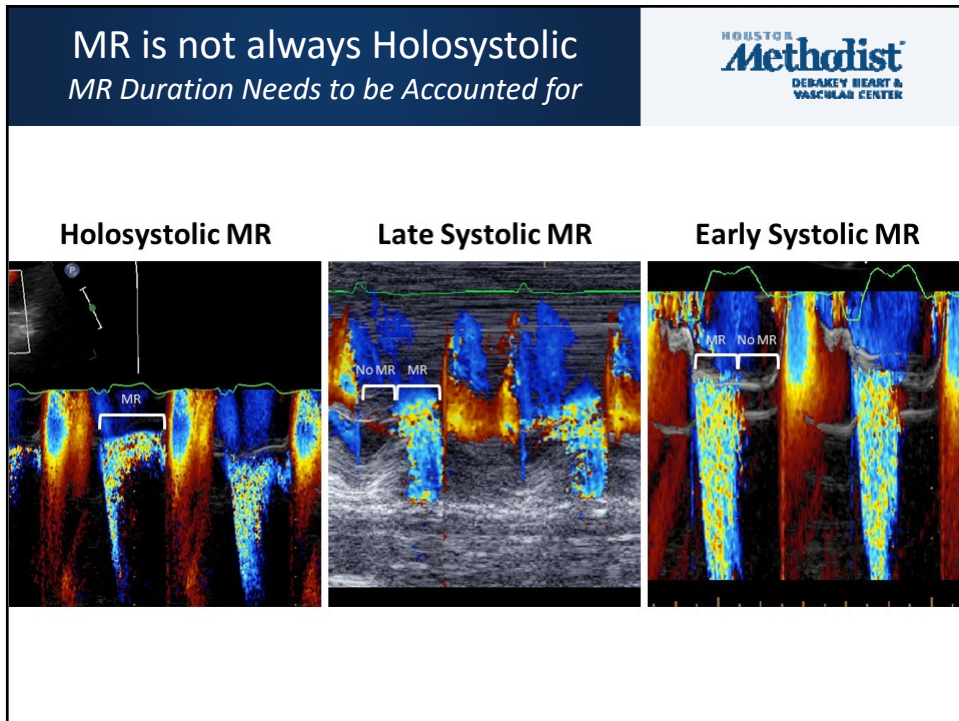

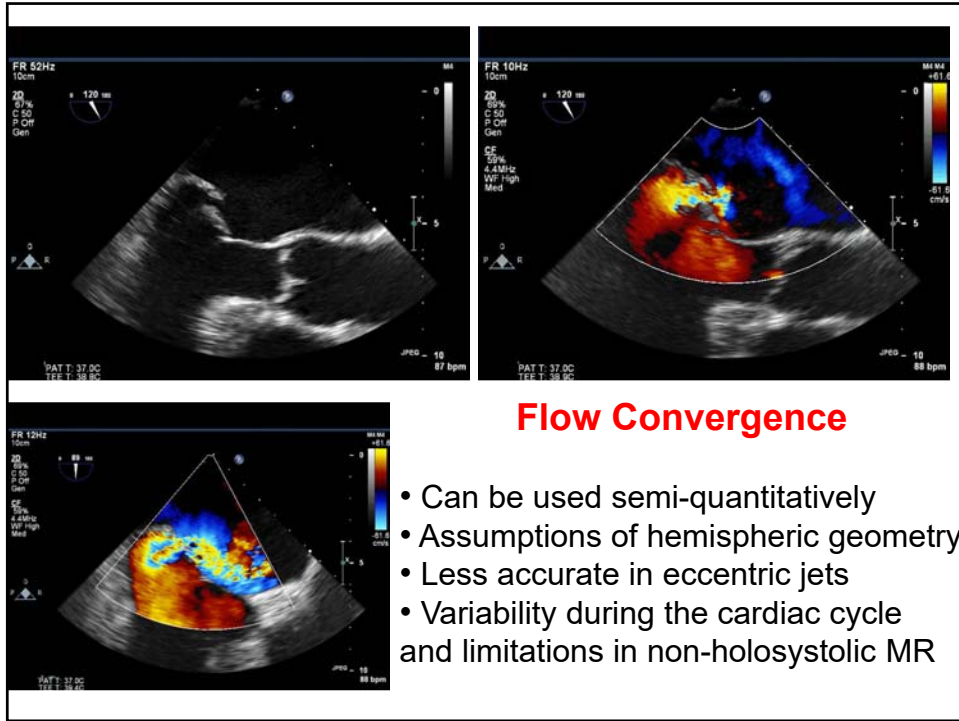

VC width (cm)

Mild	< 0.3
Moderate	0.3-0.7
Severe	> 0.7

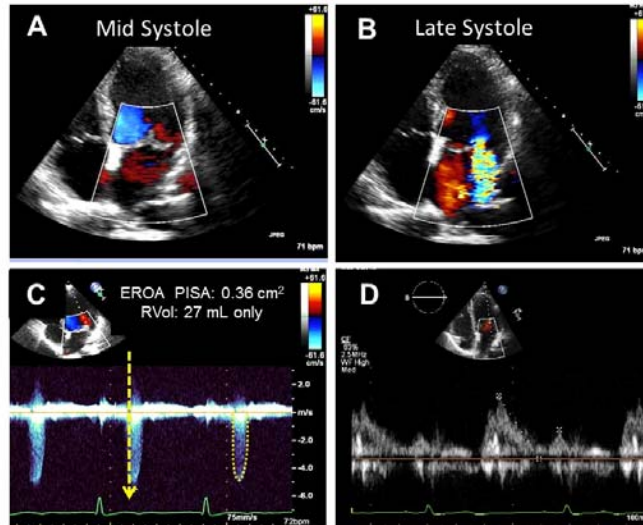

3D Echocardiography in MR Assessing VC Area

VC Area is often not circular in Secondary MR

Late Systolic MR

Quantitation of MR

D. Quantitative Doppler: EROA, Regurgitant Volume and Fraction

Flow Convergence Method (PISA):

- See PISA steps above
- Look for need for angle correction if flow convergence zone is non-planar
- Measure PISA radius (red dotted arrow in image) at roughly the same time as CW jet peak velocity

Stroke Volume Method:
Regurgitant Volume = $SV_{LVOT} - SV_{LVOT}$

- LVOT systolic diameter and pulsed Doppler sample volume from different views but at same anatomic level represents forward stroke volume
- Mitral mid-diastolic annulus and pulsed Doppler at the same annulus from apical view (represents total stroke volume)
- Total LV stroke volume can also be measured by the difference between LV end-diastolic volume and end-systolic volume (best by 3D)

- Align beam
- Zoom
- Variance off
- Nyquist shift

Reg Flow = $2\pi r^2 \times V_s$
EROA = Reg Flow/PKV_{reg}

$SV_{LVOT} = \text{Area}_{LVOT} \times VTI_{LVOT}$ $SV_{MV} = \text{Area}_{MV} \times VTI_{MV}$

Advantages:

- Rapid quantitative assessment of severity (EROA) and volume overload (RVo)
- Predict outcomes in degenerative and functional MR

Disadvantages:

- Multiple jets, eccentric jets or crescent-shaped orifices
- Small errors in radius measurement can lead to substantial errors in EROA

Measures EROA and calculates RegVol

Measures RegVol and calculates EROA

Zoghbi WA et al. J Am Soc Echocardiogr 2017; 30: 303-371.

Flow Convergence (PISA)

Flow Convergence Method

$$\text{Reg Flow} = 2\pi r^2 \times Va$$

$$\text{EROA} = \text{Reg Flow} / \text{PKV}_{\text{Reg}}$$

$$\text{R Vol} = \text{EROA} \times \text{VTI}_{\text{Reg}}$$

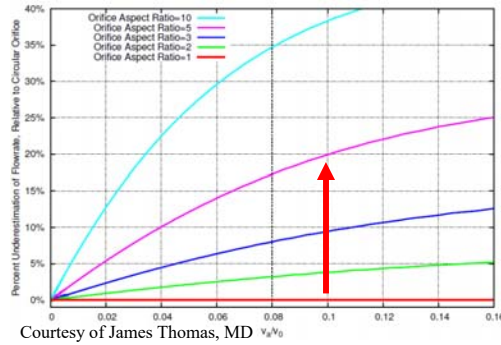

Secondary Mitral Regurgitation

Assumptions of PISA

1. Flat Surface
2. Round Hole
3. No temporal variability
4. Hemispheric Flow Convergence

Secondary MR: Crescent-shaped Orifices

Degenerative | Functional

Functional MR is particularly difficult to quantify!

Dynamic Nature of FMR

540 Hung et al. Dynamic Mitral Regurgitant Orifice Area

JACC Vol. 33, No. 2, 1999 February 1999:538-45

Early and Late systolic peak in flow and orifice area

Hung J et al. JACC 1999;33(2);538-45

Dynamic PISA

- A. FMR: early and Late peaks
- B. FMR: early peak
- C. Rheumatic: Late peak
- D. Organic: late peak

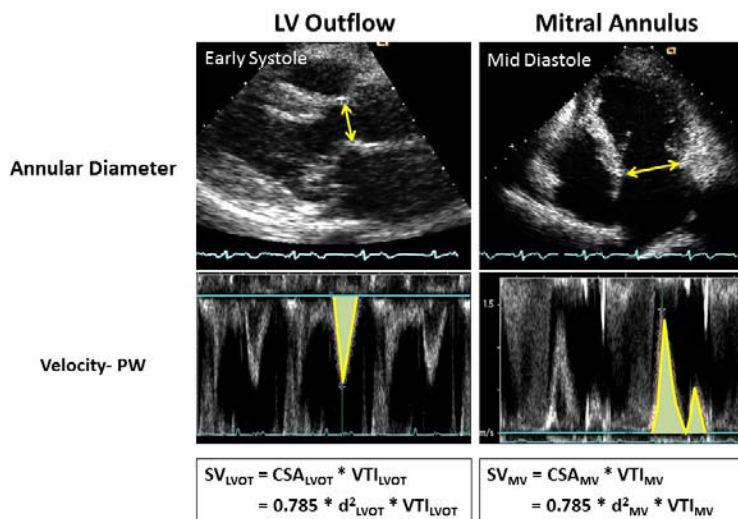

Lancellotti et al. Eur J Echocardiogr 2010;11:307-332

PISA Assumes a hemispheric flow convergence

- Assumptions
 - The regurgitant orifice is a “pinhole”
 - Flow approaches a flat surface
 - The regurgitant orifice is circular
 - The isovelocity shells are hemispheres
- Other theoretical pitfalls:
 - Doppler echocardiography measures not speed but velocity which is dependent on the cosine of the angle between the probe and the direction of flow.

Pulsed Doppler Volumetric Quantitation

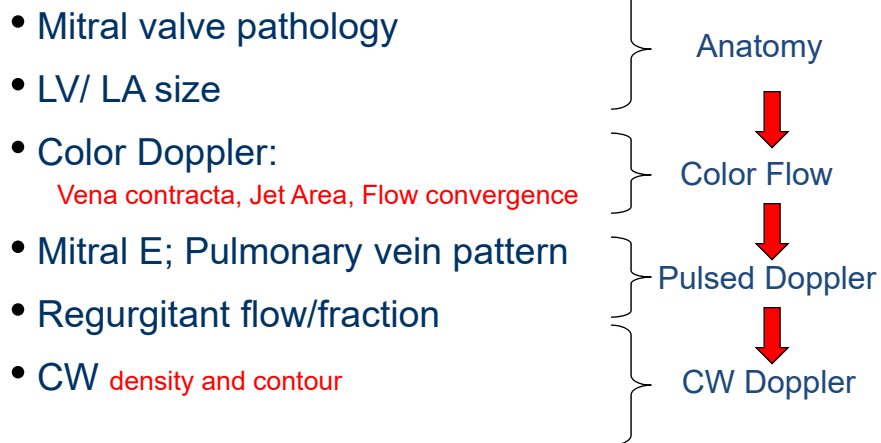

Effective Orifice Regurgitant Area & Regurgitant Volume

	Mild	Moderate		Severe
EROA (cm ²)	< 0.2	0.20-0.29	0.30-0.39	≥ 0.4
RVol (mL/beat)	< 30	30-44	45-59	≥ 60
RFraction	<30	30-39	40-49	≥ 50%

EROA cut-offs in 1^{ary} and 2nd MR are similar
RVol may be lower in 2nd MR

Mitral Regurgitation *Indicators of Severity*

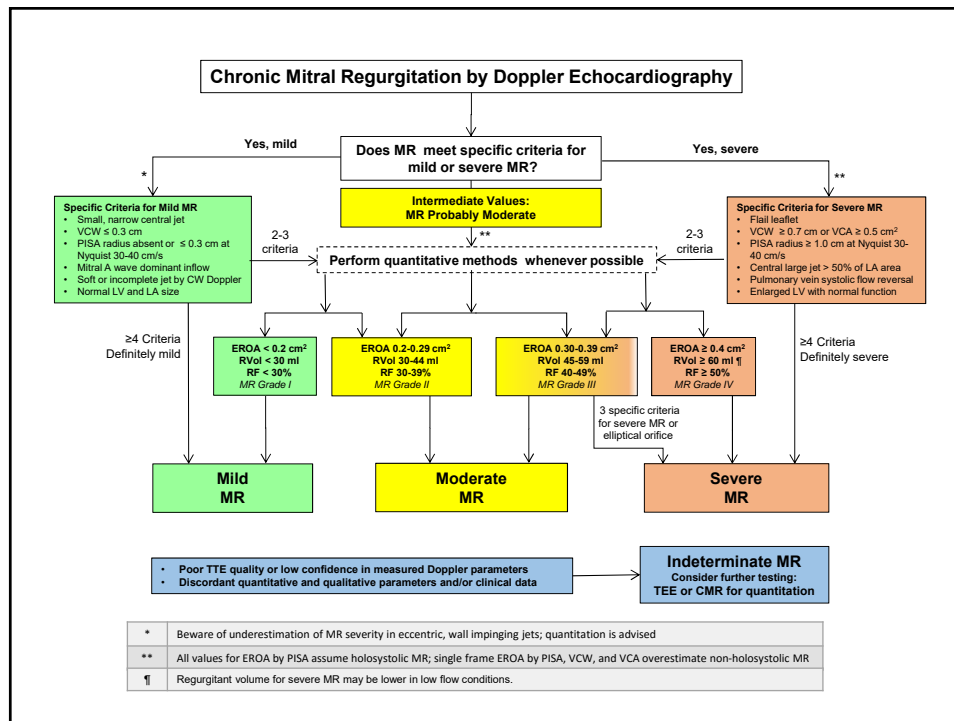

Advantages

- Quantitative, valid in multiple jets and eccentric jets
- Provides both lesion severity and volume overload

Limitations

- Needs training; Cumbersome; wide (20%) confidence limits
- Measurement of flow at MV annulus is less reliable in calcific MV and/or annulus

Quantitation of MR with CMR

LV Stroke Volume (LVSV):
 $LVSV = LVEDV - LVESV$
 $LVSV = 250 \text{ mL} - 100 \text{ mL}$
 $LVSV = 150 \text{ mL}$

Mitral Regurgitant Volume (M RVol):
 $M \text{ RVol} = LVSV - \text{Ao Stroke Volume}$
 $M \text{ RVol} = 150 \text{ mL} - 80 \text{ mL}$
 $M \text{ RVol} = 70 \text{ mL}$

Quantification of MR with CMR

LV stroke volume

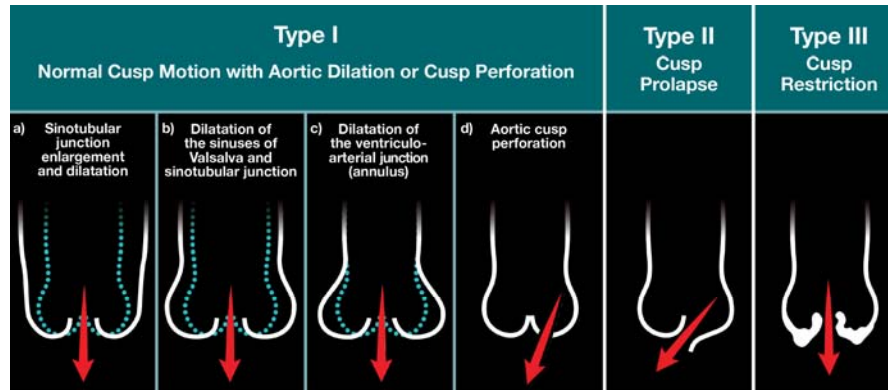

Aortic Stroke Volume

Reg Volume =
 $LV \text{ SV} - \text{Ao SV}$

Aortic Regurgitation

Aortic Regurgitation- Color Doppler

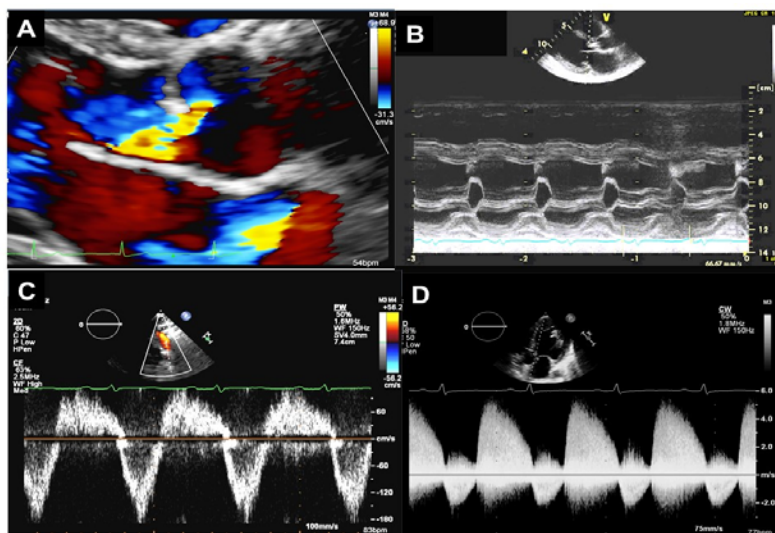

Integrative Approach to AR

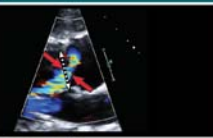

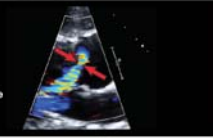

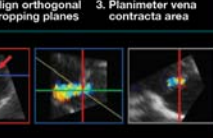

- Integrative approach should be used
 - Supportive data
 - LV/LA size
 - PHT >500
 - Specific Data (>90% Sp)
 - Reversal of flow in the aorta (EDVel >20 cm/s)
 - Vena contracta > 0.6 cm
 - % LVOT \geq 65%
 - Quantitative Data: 2D **and** 3D
 - Regurgitant Volume
 - Regurgitant Fraction
 - EROA

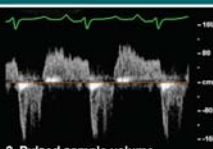

Attempt to understand discrepant measurements!

Aortic Regurgitation

A. Color Flow Doppler (2D and 3D)		
Jet Width/LVOT Diameter 1. Long-axis, zoomed view 2. Align jet to optimize VC imaging (may be different from PISA) 3. Measure jet (red arrows) in LVOT within 1cm of VC 4. Measure LVOT (white arrow)	1. Long-axis 2. Align jet 3. Measure jet (red arrows) in LVOT within 1 cm of VC 4. Measure LVOT (white arrow) 	Advantages: <ul style="list-style-type: none"> Simple sensitive screen for AR Rapid qualitative assessment Disadvantages: <ul style="list-style-type: none"> Underestimates AR in eccentric jets May overestimate AR in central jets as AR jet may expand unpredictably below the orifice Affected by the size of the LVOT
Jet Area/LVOT Area 1. Short-axis, zoom view 2. Measure in LVOT within 1 cm of the VC	1. Short-axis 2. Measure in LVOT within 1 cm of the VC 	Advantages: <ul style="list-style-type: none"> Estimate of regurgitant orifice area Disadvantages: <ul style="list-style-type: none"> Direction and shape of jet may overestimate or underestimate jet area
Vena Contracta 1. Long-axis, zoomed view 2. Align jet to optimize VC imaging (may be different from PISA) 3. Measure the narrowest jet diameter at or just apical to the valve	1. Long-axis 2. Align jet 3. Measure the narrowest jet diameter at or just apical to the valve 	Advantages: <ul style="list-style-type: none"> Surrogate for regurgitant orifice size May be used in eccentric jets Independent of flow rate and driving pressure Less dependent on technical factors Good at identifying mild or severe AR Disadvantages: <ul style="list-style-type: none"> Presence of multiple jets or bicuspid valves Convergence zone needs to be visualized The direction of the jet will influence
Proximal Flow Convergence 1. Align direction of flow withinsonation beam 2. Zoomed view 3. Variance off 4. Change baseline of Nyquist limit (in direction of jet) 5. Measure radius (white arrow in image) from point of color aliasing to vena contracta	1. Align beam 2. Zoom 3. Variance off 4. Nyquist shift (in direction of jet) 5. Radius (to vena contracta) 	Advantage: <ul style="list-style-type: none"> Rapid qualitative assessment Disadvantages: <ul style="list-style-type: none"> Multiple jets Constrained jet (aortic wall) Non-hemispheric shape Timing in early diastole
3D Vena Contracta 1. Color flow sector should be narrow 2. Align orthogonal cropping planes along the axis of the jet 3. Choose a mid-diastolic cycle 4. Non-coaxial jets or aliased flow may appear "laminar" but still represent regurgitant flow	1. Narrow color flow sector 2. Align orthogonal cropping planes 3. Planimeter vena contracta area 	Advantage: <ul style="list-style-type: none"> Multiple jets of differing directions may be measured Disadvantage: <ul style="list-style-type: none"> Dynamic jets may be over- or underestimated

B. Pulsed Wave Doppler		
Holodiastolic Flow Reversal in Proximal Descending Aorta 1. Align insonation beam with the flow 2. Pulsed sample volume in the proximal descending or abdominal aorta	1. Align beam 2. Pulsed sample volume 	Advantages: <ul style="list-style-type: none"> Simple supportive sign of severe AR More specific sign if seen in abdominal aorta Disadvantages: <ul style="list-style-type: none"> Depends on compliance of the aorta; less reliable in older patients Brief velocity reversal is normal May be seen in other conditions May not be holodiastolic in acute AR

- ◆ Aortic compliance
 - ♦ The aortic reverse/forward flow ratio (35±10%) was positively associated with parameters of aortic stiffness

Holodiastolic and rapid flow reversal can occur in elderly patients with stiff aorta, even in the absence of significant AR

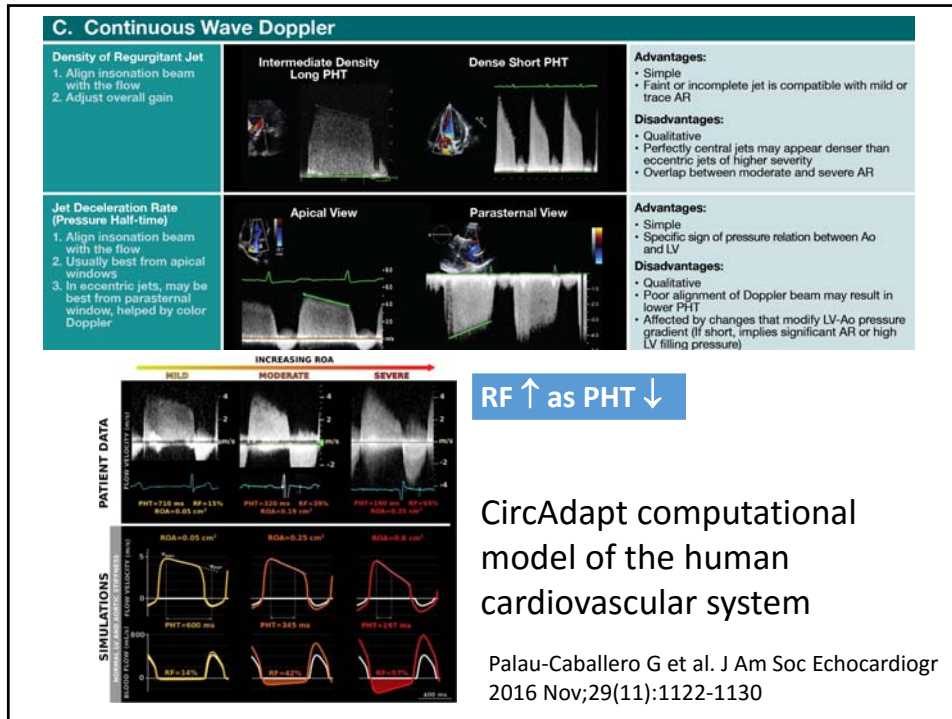

Figure 1. Representative example of ensemble-averaged descending aortic flow velocity pulse waveform. Reverse/forward flow ratio (R/F ratio) was calculated as follows: R/F ratio = $(-V_{min}) / (V_{max}) \times 100$ (%). T_{rev} indicates forward (downward) peak time; T_{rev} , reverse (upward) peak time; V_{max} , systolic forward peak velocity; V_{min} , reverse peak velocity; and V_{ED} , end-diastolic velocity.

Hashimoto, H and Ito, S. *Hypertension*. 2013;62:542-549

D. Quantitative Doppler: EROA, Regurgitation Volume and Fraction

Flow Convergence Method (PISA):

1. Align insonation beam with the flow
2. Lower the color Doppler baseline in the direction of the jet
3. Look for the hemispheric shapes to guide the best lower Nyquist limit
4. CW Doppler of regurgitant jet for peak velocity and VTI

Advantages:

- Rapid quantitative assessment of lesion severity (EROA) and volume overload (RVol)

Disadvantages:

- Feasibility is limited by aortic valve calcifications
- Not valid for multiple jets, less accurate in eccentric jets
- Small errors in radius measurement can lead to substantial errors in EROA

Stroke Volume Method: Regurgitant Volume = $SV_{LVOT} - SV_{MV}$

1. LVOT systolic diameter and pulsed Doppler sample volume from different views but at same anatomic level (represents total stroke volume)
2. Mitral mid-diastolic annulus and pulsed Doppler at the same annulus from apical view (represents forward stroke volume)
3. Total LV stroke volume can also be measured by the difference between LV end-diastolic volume and end-systolic volume (best by 3D)

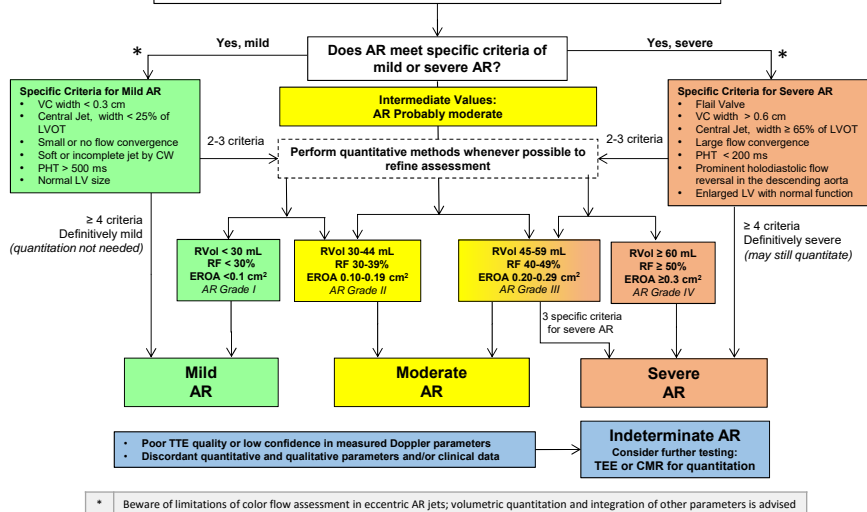

Advantages:

- Quantitative, valid with multiple jets, eccentric jets
- Provides both lesion severity (EROA, RF) and volume overload (RVol)

Disadvantages:

- Difficulties measuring mitral annulus diameter, in setting of MR, pulmonic stroke volume used for forward stroke volume
- Cumbersome, needs training
- Small errors in diameter measurement can lead to substantial errors in EROA

```

* Clinical experience in quantitation of TR is sparse

Tricuspid Regurgitation

A. Color Flow Doppler (CFD) and ECG

B. Pulmonic Wave Doppler

C. Continuous Wave Doppler

D. Quantitative Doppler (EROA, Regurgitant Volume)

The Spectrum of Tricuspid Regurgitation

Mild TR

Severe Eccentric TR

Severe Central TR

PISA in Tricuspid Regurgitation

TR Peak Velocity = 386 cm/s
VTI of jet = 109 cm

Alias Velocity = 32 cm/s
Radius = 0.9 cm

$$\text{EROA} = 6.28 * 0.9^2 * 32 / 386 = 0.4 \text{ cm}^2$$

$$\text{RVol} = 0.4 * 109 = 44 \text{ mL}$$

PISA LIMITED FOR FUNCTIONAL TR!

SEVERE x3

3D vena contracta area = 1.5 cm²

- Volume overload is well-tolerated for years
 - No reduction in RV function
 - Few symptoms of insidious onset
- Poor understanding about grading the severity of TR on Echo
 - Patients present LATE!!

TR Grading: Work in Progress

Quantitative Method	Measurements Required	Formulae	Calculations
PISA	1. PISA radius [r] 2. PISA aliasing velocity [v] 3. Regurgitant area [A] 4. TR velocity time integral [VTI] _{TR}	$ROA = \frac{A}{v}$ $Reg Vol = ROA \times TR_{VTI}$	$Q = RegVol$ $ROA = \frac{Q}{v}$ $Reg Vol = ROA \times TR_{VTI}$
Quantitative Doppler	1. TV velocity time integral [TVI] _{TV} • PIV Doppler sample volume at the annulus 2. Biplane TV annulus Area • 3D annulus area [A] • Right atrial annulus area	$ROA = \frac{RegVol}{TVI_{TV}}$ $RegVol = Forward Stroke Volume - Mitral Stroke Volume$	Diastolic Stroke Volume = $TVI_{TV} \times Area \times TV_{max}$ RegVol = Mitral Stroke Volume - Forward Stroke Volume $ROA = \frac{RegVol}{TVI_{TV}}$
3D color Doppler	1. 3D color Doppler planimetry area measurements [A] _{3D} 2. TR velocity time integral [VTI] _{TR}	$ROA = \frac{A_{3D}}{VTI_{TR}}$ $RegVol = A_{3D} \times TR_{VTI}$	$ROA = \frac{RegVol}{VTI_{TR}}$ $RegVol = A_{3D} \times TR_{VTI}$

SCOUT 1 is the first tricuspid valve device trial to use Doppler quantitative measures of disease severity

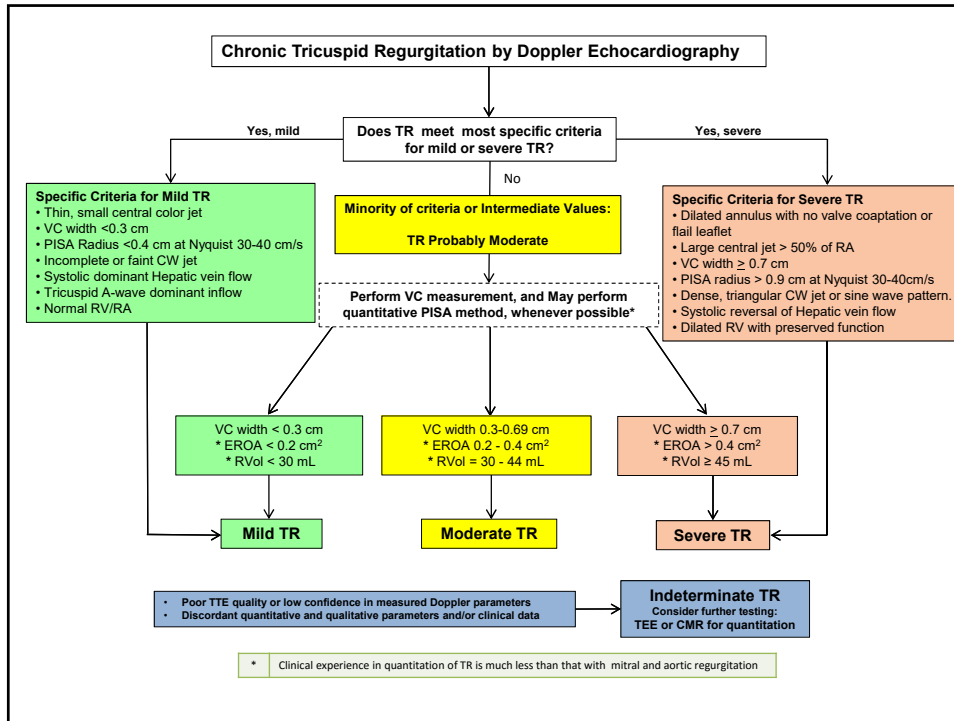

Hahn RT. *Circ Cardiovasc Imaging*. 2016 Dec;9(12)

Table 1 Proposed expansion of the 'Severe' grade

Variable	Mild	Moderate	Severe	Massive	Torrential
VC (biplane)	<3 mm	3-6.9 mm	7-13 mm	14-20 mm	≥21 mm
EROA (PISA)	<20 mm ²	20-39 mm ²	40-59 mm ²	60-79 mm ²	≥80 mm ²
3D VCA or quantitative EROA ^a			75-94 mm ²	95-114 mm ²	≥115 mm ²

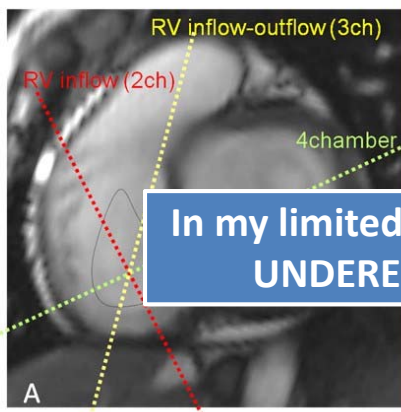

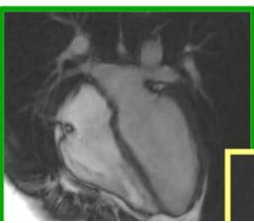

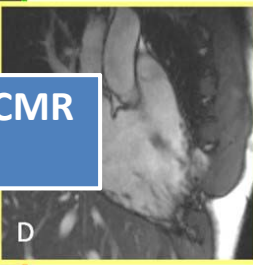

VC, vena contracta; EROA, effective regurgitant orifice area; 3D VCA, three-dimensional vena contracta area.
^a3D VCA and quantitative Doppler EROA cut-offs may be larger than PISA EROA.
